

CareOps Hackathon

Hackathon Theme

CareOps challenges you to build a **single, unified operations platform prototype** that replaces the chaos of disconnected tools used by service-based businesses.

Project Overview

Build a Unified Operations Platform (End-to-End Prototype)

Most service businesses today run on **tool chaos**.

One tool for leads.

Another for bookings.

Another for email or SMS.

Another for forms.

Another for inventory.

Another for reports.

None of these tools talk to each other.

The result?

- Leads are missed
- Follow-ups are delayed
- Bookings fall through
- Forms remain incomplete
- Inventory runs out unexpectedly
- Owners have no real-time visibility

Your task is to build **one single platform** that connects all of this into **one clear operational system**.

1. Context & Problem (Simple Explanation)

Service businesses struggle because:

- Information is scattered
- Teams work blindly
- Owners only find problems *after* damage is done

This hackathon asks you to solve that by building:

One system where the business can see, act, and operate clearly from a single dashboard.

2. What You Are Building (In Simple Terms)

You are building a **web-based operations platform** that allows a business to:

- Set up their workspace once
- Receive customer inquiries
- Accept bookings for services or meetings
- Communicate via email and SMS
- Automatically send forms after booking
- Track booking and customer status

- Track basic inventory or resources
- Receive alerts when attention is required
- Allow staff to manage daily work
- Allow owners to monitor everything from one dashboard

 **Customers do NOT log in.**

All interactions happen via links, forms, and messages.

3. Users & Roles

The system has **only two internal roles**.

3.1 Business Owner (Admin)

The owner:

- Sets up the business
- Configures the system
- Monitors performance
- Intervenes only when required

This role focuses on **visibility and control**, not daily execution.

3.2 Staff User

Staff members:

- Handle customer communication
- Manage bookings
- Track form completion
- Update booking status

They **cannot**:

- Change system configuration
- Modify automation rules

- Manage integrations
-

4. Business Onboarding Flow (MOST IMPORTANT)

This is the **foundation of the entire product**.

After onboarding, the business must be fully operational without manual intervention.

Step 1: Create Workspace

The business owner:

- Creates an account
- Creates a workspace
- Enters:
 - Business name
 - Address (important for in-person services)
 - Time zone
 - Contact email

 Nothing is active yet.

Step 2: Set Up Email & SMS

The business owner connects:

- Email service (confirmations, alerts)
- SMS service (reminders, short updates)

Rules:

- At least **one channel is mandatory**
- All communication flows through integrations
- Failures must be logged and visible

After this step:

- The Inbox becomes active
-

Step 3: Create Contact Form

The owner creates a public form with:

- Name
- Email or phone
- Optional message

When submitted:

- A Contact is created
 - A Conversation is started
 - A welcome message is sent automatically
-

Step 4: Set Up Bookings

The owner defines:

- Service / meeting types
- Duration
- Availability (days & time slots)
- Location (for in-person meetings)

This generates a **public booking page**.

Step 5: Set Up Forms (Post-Booking)

The owner uploads required forms:

- Intake form
- Agreement
- Supporting documents

Forms are linked to booking types.

When a booking occurs:

- Forms are sent automatically
 - Completion status is tracked
-

Step 6: Set Up Inventory / Resources

The owner defines:

- Items or resources used per booking
- Quantity available
- Low-stock threshold

This enables:

- Usage forecasting
 - Automated alerts
-

Step 7: Add Staff & Permissions

The owner:

- Invites staff users
 - Assigns permissions for:
 - Inbox
 - Bookings
 - Forms
 - Inventory visibility
-

Step 8: Activate Workspace

Before activation, the system verifies:

- Communication channel connected
- At least one booking type exists
- Availability is defined

Once activated:

- Forms go live
 - Booking links work
 - Automation starts running
-

5. Business Dashboard (CRITICAL SECTION)

This dashboard is **NOT for doing work**.

It exists to answer **one question only**:

| *“What is happening in my business right now?”*

Dashboard Must Clearly Show

1. Booking Overview

- Today's bookings
- Upcoming bookings
- Completed vs no-show count

2. Leads & Conversations

- New inquiries
- Ongoing conversations
- Unanswered messages

3. Forms Status

- Pending forms
- Overdue forms
- Completed forms

4. Inventory Alerts

- Low-stock items
- Critical inventory warnings

5. Key Alerts

- Missed messages
- Unconfirmed bookings
- Overdue forms
- Inventory risks

👉 Every alert must link to the exact place where action is needed.

6. Inbox (Single Source of Communication)

All communication lives here:

- Email
- SMS
- Automated messages
- Manual replies

Rules:

- One contact → one conversation
 - Full message history is preserved
 - When staff replies → automation pauses
-

7. Customer Flow (No Login)

Customers interact only through:

- Forms
 - Booking pages
 - Email/SMS
-

Flow A: Contact First

1. Customer submits contact form
 2. System:
 - Creates contact
 - Starts conversation
 - Sends welcome message
 3. Staff replies
 4. Staff shares booking link
 5. Customer books
-

Flow B: Book First

1. Customer opens booking page
2. Selects date & time
3. Enters contact details

System automatically:

- Creates contact
 - Creates booking
 - Sends confirmation
 - Sends forms
 - Schedules reminders
-

8. Staff Daily Flow

Staff log in to:

1. Open Inbox
2. Reply to customers
3. Manage bookings

4. Track form completion
5. Mark bookings as completed or no-show

Staff **cannot** change system logic.

9. Automation Rules (Strict & Predictable)

Automation must be **event-based only**.

Required rules:

- New contact → welcome message
- Booking created → confirmation
- Before booking → reminder
- Pending form → reminder
- Inventory below threshold → alert
- Staff reply → automation stops

 No hidden logic

 No magic conditions

10. Inventory Alerts

When inventory drops below threshold:

- Alert is sent (email or inbox)
 - Alert appears on dashboard
 - Event is logged
-

11. Integrations

At least **two integrations** must be implemented:

- Email provider
- SMS provider

- Calendar integration
- File storage
- Webhooks

Integrations must:

- Be abstracted
- Fail gracefully
- Never break core flows

 **Refer to the Loom video for vision alignment and detailed understanding.**

Tech Expectations

- **Frontend:** React or Next.js with responsive design for different screen sizes
 - **Backend:** FastAPI (Python) or Node.js
 - **Database:** PostgreSQL must be scalable, reliable, and well-structured
 - **Integrations:** Email, SMS, Calendar, Webhooks, etc.
 - **AI Usage:** Gemini or any suitable AI model (optional, value-added)
-

Points to Note

1. **UI/UX:** Clean, intuitive, and user-friendly design. Keep the flow smooth and simple.
2. **Code Quality:** Follow best practices and maintain well-structured code.
3. **Deployment:** Submit the deployment link and demo video.
4. **Code Submission:** You are **Not Required to submit your code**. Winners will continue development as part of the founding team under expert guidance. This challenge focuses on Skills, **AI leverage and creativity**.
5. **Use of AI Tools:** Set up Cursor or similar tools to improve productivity and speed act smartly.

6. **Discipline:** We are strict about **discipline** and behavior, so make sure to consider this. Those who stay committed, consistent, and respectful until the end will receive a certificate in recognition of their efforts.

Submission Instructions

1. **Demo Video** (3–5 minutes)
 - Walk through:
 - Worshiper flow
 - Leader flow
 - Content creation
 - Messaging
 2. **Deployment Link:** Submit a working deployment link for review.
 3. Join the Telegram group for submissions: <https://t.me/+aHXf5zBd1-Y2MWM9>
 4. **Submission Deadline : Saturday, End of the day 11:59 pm**
-

Prizes and Opportunities

-  **Hackathon Winner:**
 - The most functional and user-friendly platform creator will receive a **full-time job offer** as a **founding member with a high CTC and base pay**.
 -  **Certificates:**
 - Participants with functional MVPs, even if not winners, will receive **certificates of appreciation** if their submissions are liked by the founders.
 -  **Prizes:**
 - Depending on the submissions, prizes may be distributed to the top 3 winners. The prize amounts will be shared later.
-

Closing Note

This hackathon is more than a challenge it's a chance to **shape your future** while working on one of the most **advanced projects** out there.

It's a test for your **dedication and obsession** towards your role not just how much you know, but how much you're willing to figure out.

It's a **test of skills over resumes** in the era of AI, you're **completely free to use any AI tool** to do this assignment. What matters is how smartly you use it and how much ownership you show.

We want to work with **people who enjoy challenges**, the ones who keep pushing even when things break, and **don't stop until it finally works**.

Once you're onboard, you'll be working with a **team of geniuses** and on some seriously exciting stuff. But before that, you've got to **prove you're the right fit** for this role.

So yeah thank you for being here, and all the very best for this Hackathon!!

We're looking forward to connecting/working with the person who can ultimately get recognized as an winner of this challenge.

Also, to those who stay till the end and give it their best shot but ultimately don't end up winning, we'll be giving a **Certificate of Appreciation** for their **hard work, consistency, determination, and dedication**. Cheers and **ALL THE BEST!!!** 😊🔥.
